

### Milestone 3

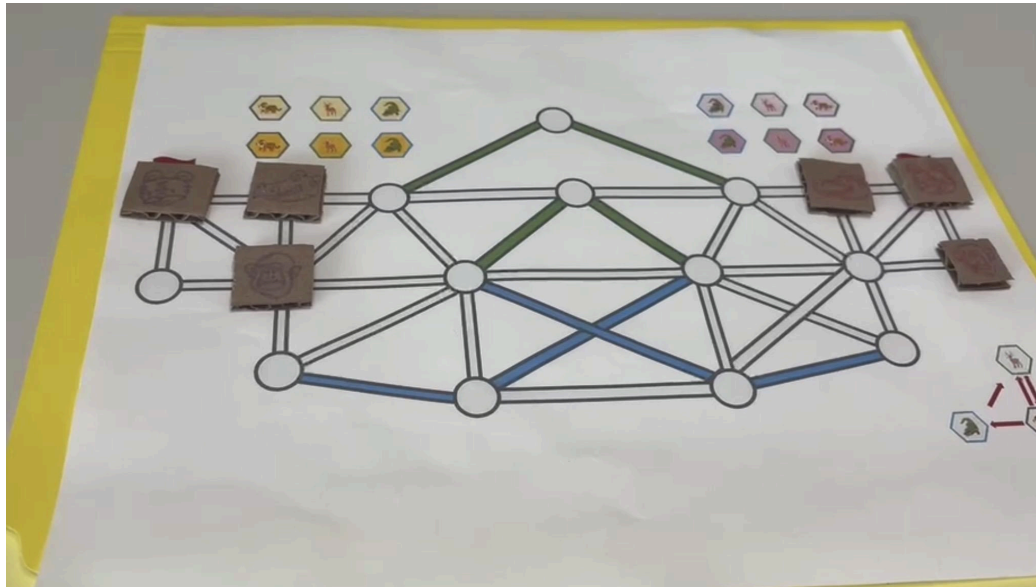

Group member: Mujia Chen, Jingyu Fu, Yingxuan Hu, Yuning Wen

#### - What have you changed since the last milestone?

Since our last milestone, we've revised the game board (map) by removing unnecessary paths to make it look more streamlined. We've also adjusted the original map by adding a few paths near each player's starting point to increase strategic options at the beginning of the game.

We replaced the deer with gorillas because this matchup is more intuitive: gorillas can challenge tigers, while tigers can still defeat them, and gorillas are also native to forest environments. So now we have gorillas, crocodiles, and tigers. They correspond to forests, rivers, and plains, respectively.

We also have a physical prototype of our game. It is not the final version yet, but it provides a rough idea and helps with playtesting.

Our game is tentatively called *Jungle Lite*, since the original prototype was called Jungle, and we reduced the number of animals and made the map smaller.

#### - What are the strengths and weaknesses of your current design, based on your playtesting?

Based on the current playtest, our strengths include: our map balances the advantage of the first player by adding an extra path for the second player. In addition, the rule that each player can move only one piece per turn helps reduce snowballing, as players who lose a piece can recover tempo more easily in subsequent turns. The phase-based activation system also makes the turn structure clearer and more manageable, especially for new players. The revised animal matchups (replacing deer with gorillas) also feel more intuitive and easier to remember. For weaknesses, I would say there is also no clear visual indicator to track which pieces have already been used in a round, which can lead to mistakes. We plan to add a visual indicator later. Finally, We plan to add decorative elements such as rivers and forests to our current map and make the game pieces more visually appealing.
